

AdBuster – How It Works (Official User Guide)

1. What is AdBuster?

AdBuster detects **audio advertisements** (TV, YouTube, radio, streaming) and **automatically mutes or lowers the volume** before the ad becomes loud. It works fully **offline**, without internet, without recording audio, and without sending anything to any server.

2. What data does AdBuster collect? (100% privacy)

The app collects only **RMS**, which is the sound level. Just a single number like **0.12, 0.34, 0.89**.

It does **NOT** collect:

- voice
- music
- conversations
- audio recordings
- personal data

Everything stays **local, anonymous, and private**.

3. ML1 – Free engine (7-day learning)

ML1:

- learns your sound environment,
- analyzes the last **7 days**,
- retrains automatically every day,
- works without a key,
- works offline,
- requires no buttons or configuration.

After a few days it becomes more accurate.

4. PRO – Deep engine (full power, unlimited history)

With a PRO key:

- the deep engine activates,
- it learns from **your entire history**, not just 7 days,
- you can collect data for **a month, a year, or even several years**,
- the only limit is your **disk space**,
- PRO works fully offline.

This is a **powerful local model** with no cloud dependency.

5. Works on any hardware (even very old machines)

AdBuster does not require a modern laptop.

It runs perfectly on:

- old laptops (10–15 years old)
- cheap notebooks
- mini PCs:
 - Intel NUC
 - Windows-based Raspberry Pi
 - generic mini computers
 - old office desktops

Because it processes only **sound level**, not audio recordings, the requirements are extremely low.

6. How to use it

Step 1: Launch AdBuster It automatically starts collecting RMS and training ML1.

Step 2: Let it run for a few days ML1 improves over time.

Step 3 (optional): Unlock PRO Enter your key → Unlock PRO → Learn Model.

Step 4: Enjoy automatic ad muting.

7. Why AdBuster is unique

It is the first app in the world that:

- detects audio ads **offline**,
- does not record sound,
- does not send data anywhere,
- learns locally,
- offers both free and PRO ML engines,
- works on any hardware,
- works with any TV, YouTube, radio, or streaming source.

----- **It is true privacy and true automation.** -----
